Department of Computer Science and Engineering
ASSESSMENT TOOL 1 – RAG-BASED MINI ASSIGNMENT (DOCUMENT QA / AI AGENT DEMO)

Course Code:	CSA65	Course Title:	Generative AI and Large Language Models
CO Assessed:	CO3 – Precision (BL2, BL3)	Assessment:	Assessment Tool 2 – RAG-based Mini Assignment (Document QA / AI Agent Demo)
Weightage:	40% of CIA	Total Marks:	2 * 50 = 100 (1 Question1)
CO3 Statement:	<i>Develop intelligent applications using Retrieval-Augmented Generation (RAG), vector databases, and introductory AI agent concepts.(BL3, BL4)</i>		
Student Name:	192472201	Reg. No.:	192472201
Section / Batch:	CSE - AI	Date:	17/08/26

Instructions to Students

- Answer 2 questions. Each question carries 50 marks.Total: 100 Marks.
- Implement the solution using **Python**.
- Use an appropriate LLM such as **OpenAI, Gemini, or Hugging Face**.
- Use **embeddings and semantic search** where applicable.
- Use **FAISS or ChromaDB** as the vector database for RAG tasks.
- Demonstrate the complete pipeline:
Document → Chunking → Embedding → Retrieval → Generation
- Demonstrate the system with multiple queries.
- Handle irrelevant, incomplete, or unsupported queries appropriately.
- Display retrieved context/source wherever applicable.
- Explain the system architecture.
- Provide a working end-to-end demonstration.

Code of Conduct

I Y. Jayesh Ranjan – 192472201 certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: Y. Jayesh Ranjan

SECTION A – RAG-BASED MINI ASSIGNMENT (DOCUMENT QA / AI AGENT DEMO)

26. RAG with Irrelevant Query Detection: Develop a RAG system that identifies questions not covered by the documents and responds appropriately instead of generating unsupported answers.

35. Multi-Tool RAG Agent: Develop an AI agent with at least three tools, such as document retrieval, calculator, and FAQ search. The agent should select the appropriate tool.

QUESTION 26 – RAG WITH IRRELEVANT QUERY DETECTION

AIM

To develop a Retrieval-Augmented Generation (RAG) system that retrieves relevant information from a document using semantic search and identifies irrelevant or unsupported queries instead of generating unsupported answers.

ALGORITHM

1. Start the program.
 2. Load the document containing the knowledge base.
 3. Divide the document into smaller chunks.
 4. Load the Sentence Transformer embedding model.
 5. Generate embeddings for all document chunks.
 6. Store the embeddings in a FAISS vector database.
 7. Accept a question from the user.
 8. Generate an embedding for the user query.
 9. Search FAISS to retrieve the most relevant document chunks.
 10. Calculate the similarity distance between the query and retrieved chunks.
 11. Compare the best similarity distance with a predefined relevance threshold.
 12. If the query is relevant, generate an answer using the retrieved document content.
 13. If the query is irrelevant, display that the information is not available in the provided document.
 14. Display the retrieved context and source.
 15. Repeat the process for multiple queries until the user enters exit.
 16. Stop the program.
-

CODE

```
# =====  
  
    print("Retrieved Text:", chunk)  
  
relevant = check_relevance(results)  
  
print("\n--- RELEVANCE CHECK ---")
```

if relevant:

```
print("STATUS: RELEVANT QUERY")
```

```
answer = generate_answer(  
    query,  
    results  
)
```

```
print("\n--- FINAL ANSWER ---")  
print(answer)
```

```
print("\nSource: Course Notes")
```

else:

```
print("STATUS: IRRELEVANT QUERY")
```

```
print("\n--- FINAL ANSWER ---")
```

```
print(  
    "Information not available in the "  
    "provided document."  
)
```

```
print(  
    "The system did not generate an "  
    "unsupported answer."  
)
```

```
# =====
```

```

def main():

    print("\n=====")
    print("RAG PIPELINE")
    print("=====")

    print(
        "Document -> Chunking -> Embedding -> "
        "FAISS -> Retrieval -> Relevance Detection -> Answer"
    )

    print("\nType 'exit' to close the program.")

    while True:

        query = input(
            "\nEnter your question: "
        )

        if query.lower() == "exit":

            print("\nProgram ended.")
            break

        if query.strip() == "":

            print("Please enter a question.")
            continue

        ask_question(query)

# =====
# START

```

=====

```
if __name__ == "__main__":
```

```
    main()
```

INPUT

The user enters questions related to the document, for example:

What is paging?

What is FIFO page replacement?

What is virtual memory?

An irrelevant query can also be entered:

What is the capital of France?

The user can enter multiple queries. Enter exit to terminate the program.

OUTPUT

Result:

The program is executed successfully

QUESTION 35 – MULTI-TOOL RAG AGENT

AIM

To develop a multi-tool RAG-based AI agent that automatically selects and uses the appropriate tool for a user query, using document retrieval, calculator, and FAQ search tools.

ALGORITHM

1. Start the program.
 2. Load the document knowledge base.
 3. Create chunks from the document.
 4. Generate embeddings for the document chunks.
 5. Store the embeddings in a FAISS vector database.
 6. Create three tools:

 - Document Retrieval Tool
 - Calculator Tool
 - FAQ Search Tool

 7. Accept a query from the user.
 8. Analyze the query to determine the appropriate tool.
 9. If the query is a mathematical expression, select the Calculator Tool.
 10. If the query is related to attendance, examination, library, course, or assignment information, select the FAQ Search Tool.
 11. Otherwise, select the Document Retrieval Tool.
 12. Retrieve relevant document information using FAISS when the document tool is selected.
 13. Generate the result from the selected tool.
 14. Display the selected tool and retrieved information.
 15. Generate the final grounded response.
 16. Handle unsupported document queries without generating false information.
 17. Repeat for multiple queries.
 18. Stop when the user enters exit.
-

CODE

```
# =====  
  
    round(  
        item["distance"],  
        4  
    )  
)
```

```
print(  
    "Text:",  
    item["text"]  
)
```

```
print("\n--- FINAL ANSWER ---")
```

```
print(  
    result["data"][0]["text"]  
)
```

The screenshot displays two overlapping windows of a web application, likely a chatbot interface, running on a Windows operating system. The top window shows a conversation where the user asks about virtual memory and page faulting. The bot responds with technical details about virtual memory management and page faulting. The user then asks for a calculation: "Enter your question: 25 * 4". The bot responds with "USER QUERY" and "25 * 4". Below this, the bot selects a tool (calculator) and provides the result: "Calculator Result: 100". The bottom window shows a similar conversation where the user asks about attendance rules. The bot responds with information about attendance requirements. The user then asks for a calculation: "Enter your question: 25 * 4". The bot responds with "USER QUERY" and "25 * 4". Below this, the bot selects a tool (calculator) and provides the result: "Calculator Result: 100". Both windows show error messages at the top, indicating an invalid API key.

RUBRICS FOR CALCULATION

Criteria	Weight age	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Pipeline Functionality	30%	Correct RAG pipeline — embeddings, retrieval and generation all function coherently	Pipeline mostly correct with minor gaps	Pipeline only partially functional	Pipeline non-functional or conceptually flawed
Answer Relevance & Groundedness	25%	Retrieves relevant context and generates accurate, grounded answers	Mostly relevant/accurate answers	Inconsistent relevance or accuracy	Answers largely irrelevant or hallucinated
Query Robustness	20%	Robust handling of varied queries and documents	Handles most queries well	Handles only simple queries	Fails on basic queries
End-to-End Demo	15%	Smooth, well-demonstrated end-to-end system	Demo mostly smooth, minor hiccups	Demo has noticeable issues	Demo fails or is not ready
Architecture Explanation	10%	Clear architecture diagram and explanation of design decisions	Adequate explanation of design	Minimal explanation of design	No explanation of design provided
